

Instructions for Implementation

General:

- Programming language is Python 3.x
- Submit your source code as .py file(s), i.e., **not** as Jupyter Notebook (no .ipynb)
- Provide a README.md with installation instructions and instructions how to run your code; this includes providing the exact bash commands in the correct order; check <https://tilburgsciencehub.com/topics/collaborate-share/share-your-work/content-creation/readme-best-practices/>
- Provide a requirements.txt containing all necessary dependencies
https://pip.pypa.io/en/stable/user_guide/
- For code development it is recommended to use versioning tools, for example TUE has a GitLab license https://gitlab.tue.nl/users/sign_in if you are new to git checkout <https://ohmygit.org/>

Code and Project Structure:

- Follow common best practices (check, e.g., <https://peps.python.org/pep-0008/>)
- Use object-oriented programming
- Make sure there is one main method to execute your code
- Make sure to provide all data and code that is necessary to reproduce your evaluation results
- NEVER use absolute paths for, e.g., reading and saving files from disc and make sure your directory structure is generic, and no adjustments must be made when your code is executed on another system
- If there are parameters that can be adjusted in your code use command line parameters or a YAML configuration file <https://github.com/cobanov/python-yaml-guide>
- Use reasonable comments

Aspects resulting in less points (besides those mentioned above):

- Too messy code (variable and function names not self-explanatory, structure unclear, missing and not reasonable comments, etc.)
- Wrong or incomplete information in README.md
- Wrong or incomplete information in requirements.txt
- If evaluation results cannot be reproduced or are not aligned with those reported in the poster and short paper.
