

<u>1JM0211 Process Mining</u>	<u>Title of your Topic</u>	
Group X Group Member Names		
<u>Motivation and Scientific Background</u> Build a convincing case here about what the approach does and why it is needed. Do this in such a way that your fellow students can understand. Guiding remarks/questions: * Motivate why the topic is relevant, e.g., by having a concrete use case or example. * How is your topic embedded in the course and related to the topics of the other groups? * What are commonalities and differences to other course/groups' topics?		
<u>Explanation of Conceptual Approach</u> Describe your approach from a conceptual point of view. Provide a visualization of your approach. Guiding remarks/questions: * What input is required for your approach? Not just describe it on a high level, i.e., if the approach requires an event log, outline also what characteristics this event log needs to fulfill, e.g., do you need the control-flow perspective or also other attributes like time, resources, etc.. * If there are parameters to be set, explain those and their purpose. * What are the most crucial steps of your approach? * What methods did you use to achieve these steps, i.e., describe in detail how your approach works? * What is the output of your approach?		
<u>Evaluation Design and Results</u> Describe the data you used for the evaluation, e.g., if and how you designed artificial data for a preliminary evaluation as well as the data provided through Canvas. Describe and motivate your evaluation design, e.g., quantitative approach measuring precision, recall or other relevant metrics; qualitative investigation of corner cases/cases that failed explaining why they failed, etc.. A combination of both is possible. Explain how you created the gold standard (ground truth) to be able to test the correctness of your approach. Explain parameter settings and testing, if applicable. Explain and visualize your evaluation results. If applicable, the results are compared to relevant related algorithms/methods.		
<u>Limitations and Future Work</u> Elaborate on limitations of, e.g., the conceptual design of the approach or observations made based on the evaluation. Outline improvement directions for future work on your approach and/or the topic in general.		

Instructions and Remarks (to be removed for printing):

Practical Hints:

- * Design your poster after you have at least a substantial draft of your short paper.
- * Avoid too much text on your poster, focus on developing visualizations that are understandable by themselves.
- * The space allocation in the template gives an indication of which parts are most relevant.

Session (Preparation) Instructions:

- * Print your poster in at least A2 and upright format.
- * Be on time to place your poster on one of the walls in the room before the session starts.
- * Please bring tape for hanging your poster.
- * During the session you will deliver a pitch on your poster and answer questions of the audience.
- * There is no fixed timing on when to give a pitch, the audience can walk around and visit posters freely.
- * Make sure that always one person is available to give the pitch during the session. The remaining group members shall visit other groups as audience.

Pitch Instructions:

- * Keep the timelimit of your pitch to 3 minutes.
- * Make sure that every group member can deliver the pitch to enable rotation.
- * Be flexible during your pitch, i.e., if the audience has questions engage in a discussion rather than continuing a monologue.
- * Align your pitch with the content of your poster; use the content to help you deliver your pitch even when you have lost track of what you want to say.
